Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 1; Fig 1; 35pp; English

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is encoded by a nitrogen regulatory PII gene. Movel plant PII (also called P-PII) nuclectide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nuclectides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

                                                                                                                                                                                                                                                                                                                                                     plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PIII mucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters and individual genomic clones sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KVEAIVRPWRIQQVSSALLKIGIRGVTVSDVRGFGAQGGSTERHGGSEFSEDKFVAKVKM 62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the present sequence is encoded by a nitrogen regulatory PII gene. ```
The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitroger assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII mucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy.

They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII mucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII spense. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform sacroharides and organic acids, nucleic acids, vitamins, saccharides and organic acids, mich particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      63

New Acinetobacter baumanni proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4 VEALVRPWRIQQVSSALLKIGIRGVTVSDVRGFGAQGGSTERHGGSEFSEDKFVAKVKME

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plant PII (also called P-PII) mucleotide sequences have been isolated.
They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII proteins are useful for in vitro screening of herbicides. P-PII with the promoters of P-PII promoters and individual genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is encoded by a nitrogen regulatory PII gene.                                                                                                                                                                                                            The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nuclectide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nuclectides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                       3 KVEAIVRPWRIQQVSSALLKIGIRGVTVSDVRGFGAQGGSTERHGGSEFSEDKFVAKVKM 62

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences. ABG00010-ABG30377 represent movel human diagnostic amino acid sequences of the invention. Note: The sequence data for this electronic format directly from MIDO at the printed specification, but was obtained in electronic format directly from MIDO at Everyones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         63

                            The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis
and adaptation (HA) proteins given in AAB79023 to AAB79242. The C.
glutamicum HA genes (I) can be used in vectors for expression in host
cells and production of fine chemicals, such as, an organic acid,
cells and production of fine chemicals, such as, an organic acid,
corpression or nonproteinogenic anino acid (preferred), purine or
pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
ce pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
corpression or enzyme. The amino acids produced can be lysine, glutamine,
collutamate, alanine, aspartate, glycine, serine, threonine, methionine,
corpressine, phenylalanine, or tryptophan. The fine chemical production can
complated. The presence or activity of Corynebacterium diphtheriae.
Corpressine, phenylalanine, or tryptophan. The fine chemical production can
conditated. The presence or activity of Corynebacterium diphtheriae.
Corpressine the presence or activity of Corynebacterium diphtheriae.
Corpressine conded to map the C. glutamicum genome or can be used as markers
corpressine ancoded by the (I) are used to maintain homeostasis in C.
Corpression or help the microorganism to adapt to different environmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated Corynebacterium glutamicum nucleic acid for production or modulation of production of fine chemicals such as amino acids, nucleosides, nucleotides, lipids, fatty acids, carbohydrates, vitamins

```
sequence (ABA90521) and related proteins (ABB5300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and patent WO20017334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the wipo.in:/pub/published_pot_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                               The present invention is related to a Lactococcus lactis nucleotide
                                                                                                                                                                                                             New nucleotide sequence useful in the identification or Lactococcus
                                                                                                                                    Bolotine A, Sorokine A, Renault P, Ehrlich SD;
                                                                                                                                                                                                                                                                      Claim 6; SEQ ID NO 1639; 2504pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A, Pathway: nitrogen regulation pathway
A;Note: this protein participates indirectly in activation of glutamine synthase activit
A;Note: under nitrogen-limiting conditions it is covalently uridylylated; in nitrogen extransferase / uridylyl-removing enzyme which is regulated by the glutamine/alpha-ketoglu
                                                                                                                                        8

J. Bacteriol. 177:5912-5917(1995).
-!-FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS
GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO
NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II
IS PHOSPHATE, THE TRANSCRIPTIONS ARE REVERSED.
-!-FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN
TO 2-KETOGLUTARATE DECREASES, P-II IS PHOSPHORYLATED WHICH ALLONS
THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING
THE ENZYME.
                                                                                                                                                                                                                                                                                       "Photosynthetic electron transport controls nitrogen assimilation in cyanobacteria by means of posttranslational modification of the glnB

Purification and properties of PII protein and nucleotide sequence of
             P-11-UMP ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHERAGE (68), THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS P-11 IS DEURIDYLATED AND PROMOTES THE ADENTATION OF GS.
FUNCTION: P-11 INDIRECTLY CONTECLS THE TRANSCRIPTION OF THE GS GENE (GLNA). P-11 PREVENTS NR-11 CATALYZED CONVERSION OF NR-1 TO NR-1-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-11 IS URITYLYLATED TO P-11-UMP, THESE EVENTS ARE REVERSED.
SUBUNIT: HOMOTIMER (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1; Gaps

LIDIAL STRUCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLOTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS NR.II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE DEADENDENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE BNZYME.

SUBUNIT: HOMOLIMMER (By similarity).

-! SIMILARITY: Belongs to the P(II) protein family.
                                                                                                                                                                          Gaps

sphaerotides glnB and glnA genes.";

Microbiology 140.2143-2151(1994).

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE
GLUTAMINE SYNTHERIASE GRNE (GLNA). P-II PREVENTS NR.-II CATALYZED
CONVERSION OF NR.-I TO NR.-I-PHOSPHATE, THE TRANSCRIPTIONAL
ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLATED TO P-II-UMP, THESE
EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE
DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE ENZYME.
-I- SUBBUNT: Homotrimer (By similarity).

-I- SUBBUNT: Belongs to the P(II) protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3 KVEAIVREWRIQQVSSALLKIGIRGVIVSDVRGFGAQGGSTERHGGSEFSEDKFVAKVKM

Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 1; Fig 1; 35pp; Bnglish.

The present sequence is encoded by a nitrogen regulatory PII gene. Movel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII promoters are 11 promoters are useful are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3 KVEAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVKM 62

```
The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3 KIRALIKPPKLDEVKRALHBVGIKGITVTBAKGFGROKGHTELYRGAEYVVD-FLPKVKI 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in recoids ABPR16736-ABP81046 represent nucleic acid molecules of the invention

Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent electronic form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         62

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nuclectide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3 KVBAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVKM

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      16 VTAIVXPFKLDDVREALSDIGVQGITVTEVKGFGRHKGHTELYRGAEYVVD-FLPKVKIB 74
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4 VEALLRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSEFSEDKFVAKVKME

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen sasimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of 11. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food
                                                                                                                                                                                                                                                                                                                                                                                                                              3 KIRALIKPFKLDEVRS-LSGVGLQGITVTEAKGFGRQKGHTDLYRGAEYIVD-FLPKVXI 60
